Competitive location – problem formulation

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

- State of research
- Why Dynamic Programming fails
- The solution: k-sum optimization
- Outlook

Location Problems

- Input: A Graph. Users located at nodes.
- Output: Placement of Facilities
- Goal: Serve customers, optimizing various costs

Location Problems

- Input: A Graph. Users located at nodes.
- Output: Placement of Facilities
- Goal: Serve customers, optimizing various costs

Location Problems (Examples)

Set X of facilities

Minimize Objective	Problem
$\frac{\sum_{v} d(v, X)}{\max_{v} d(v, X)}$	p-Median p-Center
$\sum_{x\in X} f(x) + \sum_{v} d(v, X)$	Facility Location

Set X of facilities

Minimize Objective	Problem
$\sum_{v} d(v, X)$	<i>p</i> -Median
$\max_{v} d(v, X)$	<i>p</i> -Center
$\sum_{x\in X} f(x) + \sum_{v} d(v, X)$	Facility Location

Set X of facilities

Minimize Objective	Problem
$\frac{\sum_{v} d(v, X)}{\max_{v} d(v, X)}$	<i>p</i> -Median <i>p</i> -Center
$\sum_{x\in X} f(x) + \sum_{v} d(v, X)$	Facility Location

Set X of facilities

Minimize Objective	Problem
$\frac{\sum_{v} d(v, X)}{\max_{v} d(v, X)}$	<i>p</i> -Median
$\sum_{x \in X} f(x) + \sum_{v} d(v, X)$	Facility Location

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Prior: one central planner

Now: two competitive providers

Competing providers locate facilities on a graph

- Graph G = (V, E)
- Edge lenghts $d \colon E \to \mathbb{R}_0^+$
- Node weights $w: V \to \mathbb{R}^+_0$
- Users are located at nodes
- Facilities may be placed along edges

User *u* prefers *X* over *Y*:

 $X \prec_u Y$: \iff d(u, X) < d(u, Y) $w(X \prec Y)$: weight of users preferring X

Example of Competitive Providers

• blue users prefer facility X

• red users prefer facility Y

(日) (字) (日) (日) (日)

Example of Competitive Providers

- blue users prefer facility X
 - $w(X \prec Y) = 8$
- red users prefer facility Y
 - $w(Y \prec X) = 7$

Providers place sequentially ...

- Leader places p facilities (~ leader problem)
- Sollower places r facilities (→ follower problem)
- ... each maximizes own benefit (sum of user demand)

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Let us start with the follower problem...

Given X, what is the best choice for the follower?

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Given X, what is the best choice for the follower?

•
$$w(Y' \prec X) = 7$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ○臣 - のへで

Given *X*, what is the best choice for the follower?

•
$$w(Y' \prec X) = 7$$

• $w(Y'' \prec X) = 8$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Given *X*, what is the best choice for the follower?

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Definition Follower Problem

Definition (Hakimi '83)

Given *p*-element leader placement X_p , define

$$w_r(X_p) := \max_{\substack{Y_r \subseteq G \\ |Y_r|=r}} w(Y_r \prec X_p),$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

which denotes the maximum gain of follower.

Definition Follower Problem

Definition (Hakimi '83)

Given *p*-element leader placement X_p , define

$$w_r(X_{\rho}) := \max_{\substack{Y_r \subseteq G \\ |Y_r|=r}} w(Y_r \prec X_{\rho}),$$

which denotes the maximum gain of follower.

Definition (Hakimi '83)

We call an *r*-element follower placement Y_r with

$$w(Y_r \prec X_p) = w_r(X_p)$$

(日) (日) (日) (日) (日) (日) (日)

an (r, X_p) -Medianoid.

•
$$X_{\rho} \mapsto W_r(X_{\rho})$$

- $X_{\rho} \mapsto w_r(X_{\rho})$
- ... the leader gets the rest

(日) (日) (日) (日) (日) (日) (日)

- $X_{\rho} \mapsto w_r(X_{\rho})$
- ... the leader gets the rest
- \rightsquigarrow find X_p which **minimizes** $w_r(\cdot)$

Open one of three facilities

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

Open one of three facilities ...

・ロト ・ 同ト ・ ヨト ・ ヨ

Open one of three facilities

(日) (字) (日) (日) (日)

• $w_1(\mathbf{R}) = \max\{w_1(\mathbf{G} \prec \mathbf{R}), w_1(\mathbf{B} \prec \mathbf{R})\} = 8$

Open one of three facilities ...

(日) (字) (日) (日) (日)

• $w_1(R) = \max\{w_1(G \prec R), w_1(B \prec R)\} = 8$ • $w_1(G) = \max\{w_1(B \prec G), w_1(R \prec G)\} = 8$

Open one of three facilities ...

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

- $w_1(\mathbf{R}) = \max\{w_1(\mathbf{G} \prec \mathbf{R}), w_1(\mathbf{B} \prec \mathbf{R})\} = 8$
- $w_1(G) = \max\{w_1(B \prec G), w_1(R \prec G)\} = 8$
- $w_1(B) = \max\{w_1(G \prec B), w_1(R \prec B)\} = 7$

Open one of three facilities ...

(日) (字) (日) (日) (日)

- $w_1(\mathbf{R}) = \max\{w_1(\mathbf{G} \prec \mathbf{R}), w_1(\mathbf{B} \prec \mathbf{R})\} = 8$
- $w_1(G) = \max\{w_1(B \prec G), w_1(R \prec G)\} = 8$
- $w_1(B) = \max\{w_1(G \prec B), w_1(R \prec B)\} = 7$
- \Rightarrow Blue is the optimal leader position

Definition (Hakimi '83)

Given r, p, we define

$$w_{r,p}(G) := \min_{\substack{X_p \subseteq G \ |X_p| = p}} w_r(X_p),$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Definition (Hakimi '83)

Given *r*, *p*, we define

$$w_{r,p}(G) := \min_{\substack{X_p \subseteq G \ |X_p| = p}} w_r(X_p),$$

Definition (Hakimi '83)

Given r, p, we call a *p*-element leader placement X_p with

$$w_r(X_p) = w_{r,p}(G)$$

Approximability on paths and trees?

Competitive location – problem formulation

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

- State of research
- Why Dynamic Programming fails
- The solution: k-sum optimization
- Outlook

• Typical Approach: pseudopolynomial algorithm and scaling

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

 Dynamic Programming requires optimal substructure property

▲□▶▲□▶▲□▶▲□▶ □ ● ○○○

 $w_r(X_{\rho}) = w_{r_1}(X_{\rho_1}) + w_{r_2}(X_{\rho_2})$

 $w_r(X_{\rho}) = w_{r_1}(X_{\rho_1}) + w_{r_2}(X_{\rho_2})$

However the problem is not splittable!

Leader always locates at Ω node ~→ split

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

- Leader always locates at Ω node \rightsquigarrow split
- Locate the second facility at the right subpath

(日) (日) (日) (日) (日) (日) (日)

- Leader always locates at Ω node \rightsquigarrow split
- Locate the second facility at the right subpath

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○

• Local (1, 1)-centroid is at 10 (split equally)

- Leader always locates at Ω node \rightsquigarrow split
- Locate the second facility at the right subpath
- Local (1, 1)-centroid is at 10 (split equally)
- Local (2, 1)-centroid is at 14 (heaviest node)

(日) (日) (日) (日) (日) (日) (日)

- Leader always locates at Ω node \rightsquigarrow split
- Locate the second facility at the right subpath
- Local (1, 1)-centroid is at 10 (split equally)
- Local (2, 1)-centroid is at 14 (heaviest node)

(日) (日) (日) (日) (日) (日) (日)

But 13 is the best choice!

- Leader always locates at Ω node \rightsquigarrow split
- Locate the second facility at the right subpath
- Local (1, 1)-centroid is at 10 (split equally)
- Local (2, 1)-centroid is at 14 (heaviest node)
- But 13 is the best choice!
- If we change the weight of the leftmost node...
- ... the optimum switches to 12

Generalization ...

• Every node v_i can be part of a (2,2)-centroid ...

k-Sum Optimization Problem (Punnen '96)

Given:

- Set $E = \{e_1, \ldots, e_m\}$ of weighted ground elements
- Family $\mathcal{F} = \{F_1, F_2, \dots, F_n\}$ with $F_i \subseteq E$

k-Sum Optimization Problem (Punnen '96)

Given:

- Set $E = \{e_1, \ldots, e_m\}$ of weighted ground elements
- Family $\mathcal{F} = \{F_1, F_2, \dots, F_n\}$ with $F_i \subseteq E$

- $c_k(F_i) :=$ sum of the *k* heaviest elements in F_i
- *c*(*F_i*) := sum of **all** elements \rightsquigarrow **minisum** problem

k-Sum Optimization Problem (Punnen '96)

Given:

- Set $E = \{e_1, \ldots, e_m\}$ of weighted ground elements
- Family $\mathcal{F} = \{F_1, F_2, \dots, F_n\}$ with $F_i \subseteq E$

Task: Compute F_i minimizing $c_k(\cdot)$

- $c_k(F_i) :=$ sum of the *k* heaviest elements in F_i
- *c*(*F_i*) := sum of **all** elements \rightsquigarrow **minisum** problem

k-Sum Optimization Problem (Punnen '96)

Given:

- Set $E = \{e_1, \ldots, e_m\}$ of weighted ground elements
- Family $\mathcal{F} = \{F_1, F_2, \dots, F_n\}$ with $F_i \subseteq E$

Task: Compute F_i minimizing $c_k(\cdot)$

- $c_k(F_i) :=$ sum of the *k* heaviest elements in F_i
- c(F_i) := sum of all elements → minisum problem
- Examples: k-sum shortest path, k-sum MST

Theorem (Punnen '96)

A *k*-sum optimization problem is easy if the corresponding minisum problem is tractable

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ◆ ○○○

Introduce "Water Level" z

Theorem (Punnen '96)

A *k*-sum optimization problem is easy if the corresponding minisum problem is tractable

Introduce "Water Level" z

•
$$w^{(z)}(e_i) := w(e_i) \div z := \max\{w(e_i) - z, 0\}$$

Theorem (Punnen '96)

A *k*-sum optimization problem is easy if the corresponding minisum problem is tractable

- Introduce "Water Level" z
- $w^{(z)}(e_i) := w(e_i) z := \max\{w(e_i) z, 0\}$
- Consider minisum problem under $w^{(z)}(\cdot)$

Theorem (Punnen '96)

A *k*-sum optimization problem is easy if the corresponding minisum problem is tractable

- Introduce "Water Level" z
- $w^{(z)}(e_i) := w(e_i) z := \max\{w(e_i) z, 0\}$
- Consider minisum problem under $w^{(z)}(\cdot)$
- For some *z*, **minisum** under *w*^(*z*) and *k*-sum under *w* become **equivalent**

• Observe that
$$w_r(X_p) = \sum_{i=1}^r \delta_i$$

Hence the follower chooses the r largest incremental gains

- We consider X_p as sorted vector of 2p incremental gains δ₁ ≥ δ₂ ≥ ... ≥ δ_{2p}
- Observe that $w_r(X_p) = \sum_{i=1}^r \delta_i$
- According to Punnen: need to solve the minisum problem under reduced cost w^(z)(X_p) := Σ^{2p}_{i=1}(δ_i ∸ z)

Solving the minisum problem

This new problem is splittable.

$$R^{(z)}(\pi+1,W) = \max\left\{ \begin{array}{ll} x \mid \exists (W_0,\tilde{W}) \colon W_0 + \tilde{W} = W \\ \text{and} \\ w^{(z)}(R^{(z)}(\pi,W_0),x) \leq \tilde{W} \end{array} \right\}$$

- *R*^(z) rightmost leader position of placing π servers such that *w*^(z) restricted to the interval [0, *R*^(z)] does not exceed *W*
- $w^{(z)}(a,b)$ reduced gain in interval [a,b]

Approximating the (r, p)-Centroid

Computing (r, p)-centroid

An (r, p)-centroid of a path *P* can be computed in pseudo-polynomial running time $O(p \cdot w(P)^2 \cdot n^2)$.

and by scaling we obtain...

Approximating (r, p)-centroid

There is a FPTAS for (r, p)-centroid on a path.
